Revision History

Version	Description	Date
V1.0.0	Initial release.	July 27, 2017
V1.0.1	Added the **Enable/Disable PDF417 ECI Output**, **Enable/Disable QR ECI Output** and **Enable/Disable Data Matrix ECI Output** features in Chapter 8. Note: Firmware version V1.00.088 or later is required for the new features above.	November 10, 2017
V1.0.2	Updated the "Dimensions" section in Chapter 1.	February 26, 2018

Table of Contents

Chapter 1 Getting Started

Introduction

The NLS-FM305X-2X fixed mount barcode scanner (hereinafter referred to as **"FM30 scanner"** or **"the FM30"** or **"the scanner"**), armed with the world-leading Newland patented **UIMG°**, a computerized image recognition system-on-chip, bring about a new era of 2D barcode scanner.

The FM30 supports all mainstream 1D and standard 2D barcode symbologies (e.g., PDF417, QR Code M1/M2/Micro, Data Matrix and Chinese Sensible Code) as well as GS1-DataBar™(RSS) (Limited/Stacked/Expanded versions). It can read barcodes on virtually any medium - paper, plastic card, mobile phones and LCD displays.

Designed for fixed mount integrations, this scanner is easy to fit into various equipment such as self-service cabinets, vending machines, ATMs, access control, retail POS and fast food self-ordering kiosks.

About This Guide

This guide provides programming instructions for FM30 scanner. Users can configure the scanner by scanning the programming barcodes included in this manual.

The scanner has been properly configured for most applications and can be put into use without further configuration. Users may check **Appendix 1: Factory Defaults Table** for reference. Throughout the manual, asterisks (**) indicate factory default values.

Unpacking

Open the package and take out the scanner and its accessories. Check to make sure everything on the packing list is present and intact. If any contents are damaged or missing, please keep the original package and contact your dealer immediately for after-sales service.

Connecting the FM30 to a Host Device

The scanner must be connected to a host device in actual application, such as PC, POS or any intelligent terminal with USB or RS-232 port, using a USB or RS-232 cable.

USB

USB port on the host device
RS-232

RS-232 port on the host device

Note: Please check the port on the host device and purchase the cable accordingly.
Using USB Cable
Connect the scanner to a host device with a USB cable with RJ45 and USB connectors:

1. Plug the cable's RJ45 connector into the data port on the scanner.

2. Plug the cable's USB connector into the USB port on the host device.

Using RS-232 Cable
Connect the scanner to a host device with an RS-232 cable with RJ45, RS-232 connector and a power jack:

1. Plug the cable's RJ45 connector into the data port on the scanner.

2. Plug the cable's RS-232 connector into the RS-232 port on the host device.

3. Plug the power adapter into the power jack of the cable.

4. Connect the power adapter to a power outlet.

Maintenance

✧   The scan window should be kept clean.

✧   Do not scratch the scan window.

✧   Use soft brush to remove the stain from the scan window.

✧   Use the soft cloth to clean the window, such as eyeglass cleaning cloth.

✧   Do not spray any liquid on the scan window.

✧   Do not use any detergent to clean other parts of the device except for water.

Note: The warranty DOES NOT cover damages caused by inappropriate care and maintenance.

Scanning Instructions

1. Present the barcode in front of the scan window of the scanner, adjusting the distance between them within the range of 1cm-5cm.

2. For a successful read, the scanner will beep and send the data to the host.

Barcode Programming

Scanning the **Enter Setup** barcode can enable the scanner to enter the setup mode. Then you can scan a number of programming barcodes to configure your scanner. To exit the setup mode, scan the **Exit Setup** barcode.

If the scanner has exited the setup mode, only some special programming barcodes, such as the **Enter Setup** barcode and **Restore All Factory Defaults** barcode, can be read.
```
|||||| || ||||||| ||||||||||||          |||||| || ||||||| ||||||||||||
@SETUPN1                                 @SETUPN0
```
Enter Setup   **** Exit Setup**

Programming barcode data (i.e. the characters under programming barcode) can be transmitted to the host device. Scan the appropriate barcode below to enable or disable the transmission of programming barcode data to the host device.

Restarting the scanner will automatically disable the transmisison of programming barcode data to the host device.

```
|||||| || ||||||| ||||||||||||          |||||| || ||||||| ||||||||||||
#SETUPT1                                 #SETUPT0
```
Transmit Programming Barcode Data   **** Do Not Transmit Programming Barcode Data**

Factory Defaults

Scanning the following barcode can restore the scanner to the factory defaults. See **Appendix 1: Factory Defaults Table** for more information.

Note: Use this feature with discretion.

||||| |||||| || ||||| ||||||
@FACDEF

Restore All Factory Defaults

Custom Defaults

Custom defaults make it possible to save the frequently-used settings on the scanner.

Scanning the **Save as Custom Defaults** barcode can save the current settings as custom defaults. Once custom default settings are stored, they can be recovered at any time by scanning the **Restore All Custom Defaults** barcode.

Custom defaults are stored in the non-volatile memory. Restoring the scanner to the factory defaults will not remove the custom defaults from the scanner.

||||| |||||| || ||||| ||||||
@CUSSAV

Save as Custom Defaults

||||| |||||| || ||||| ||||||
@CUSDEF

Restore All Custom Defaults

Query Product Information

After scanning the barcode below, the product information (such as firmware version, model number, serial number and manufacturing date) will be sent to the host device.

||||| |||||| || ||||| ||||||
@QRYSYS

Query Product Information

||||| |||||| || ||||| ||||||
@SETUPN0

Chapter 2 Communication Interfaces

The scanner provides an RS-232 interface and a USB interface to communicate with the host device. The host device can receive scanned data and send commands to control the scanner or to access/alter the configuration information of the scanner via the interface.

RS-232 Interface

When the scanner is connected to the RS-232 port of a host device, the scanner will automatically enable RS-232 communication. However, you need to set communication parameters (including baud rate, parity check, data bit and stop bit) to match the host device.

Default serial communication parameters are listed below. Make sure all parameters match the host requirements.

Parameter	Factory Default
Baud Rate	115200
Parity Check	None
Data Bits	8
Stop Bits	1
Hardware Flow Control	None
Baud Rate

Baud rate is the number of bits of data transmitted per second. Set the baud rate to match the Host requirements.

USB Interface

USB HID-KBW

When you connect the scanner to the host device via a USB connection, you can enable the **USB HID-KBW** feature by scanning the barcode below. Then scanner's transmission will be simulated as USB keyboard input. The host device receives keystrokes on the virtual keyboard. It works on a Plug and Play basis and no driver is required.

@INTERF3
** USB HID-KBW
USB Country Keyboard Types

Keyboard layouts vary from country to country. The default setting is U.S. keyboard.

Convert Case

Scan the appropriate barcode below to convert barcode data to your desired case.

@KBWCAS0

** No Case Conversion

@KBWCAS1

Convert All to Upper Case

@KBWCAS2

Convert All to Lower Case

Example: When the **Convert All to Lower Case** feature is enabled, barcode data "AbC" is transmitted as "abc".

@SETUPN0

** Exit Setup

Emulate ALT+Keypad

This feature allows any ASCII character (0x00 - 0xFF) to be sent over the numeric keypad no matter which keyboard type is selected. Since sending a character involves multiple keystroke emulations, this method appears less efficient.

The following options are available:
- **Disable:** No ASCII character is sent in the ALT+Keypad way.
- **Mode 1:** ASCII characters not supported by the selected keyboard type but falling into 0x20~0xFF are sent in the ALT+Keypad way.
- **Mode 2:** ASCII characters falling into 0x20~0xFF are sent in the ALT+Keypad way.
- **Mode 3:** ASCII characters falling into 0x00~0xFF are sent in the ALT+Keypad way.

Note: In the event of a conflict between **Function Key Mapping** and **Mode 3**, **Function Key Mapping** shall govern.

@KBWALK0
** Disable

@KBWALK1
Mode 1
@KBWALK2
Mode 2

@KBWALK3
Mode 3

Example: Supposing US keyboard is selected, barcode data "AĐF" (65/208/70) is sent as below:

(1) **Mode 1** is enabled:

"A" -- Keystroke "A"

"Đ" -- "ALT Make" + "208" + "ALT Break"

"F" -- Keystroke "F"

(2) **Mode 3** is enabled:

"A" – "ALT Make" + "065" + "ALT Break"

"Đ" -- "ALT Make" + "208" + "ALT Break"

"F" -- "ALT Make" + "070" + "ALT Break"
Function Key Mapping

When Function Key Mapping is enabled, function characters (0x00 - 0x1F) are sent as ASCII sequences over the keypad. For more information, see **Appendix 8: ASCII Function Key Mapping Table**.
@KBWFKM1
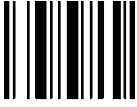

Enable Function Key Mapping

@KBWFKM0

** Disable Function Key Mapping

Example: Barcode data 0x16

T	Enable Function Key Mapping	Ctrl+V
	Disable Function Key Mapping	F1

Emulate Numeric Keypad

When this feature is disabled, sending barcode data is emulated as keystroke(s) on main keyboard.

To enable this feature, scan the **Emulate Numeric Keypad** barcode. Sending a number (0-9) is emulated as keystroke(s) on numeric keypad, whereas sending other characters like "+", "-", "*", "/" and "." is still emulated as keystrokes on main keyboard.
||||| ||| |||||| ||| |||||| |||||
@KBWNUM0

** Do Not Emulate Numeric Keypad

||| ||||| ||| |||| |||||| ||||||
@KBWNUM1

Emulate Numeric Keypad

Code Page

The **Code Page** programming feature is provided to support more international characters. This feature is only effective when ASCII characters are sent in the ALT+Keypad way.

||||| ||| |||||| ||| |||||| |||||
@KBWCPG0

** Windows 1252 (Latin I)

||| ||||| ||| |||| |||||| ||||||
@KBWCPG1

USB COM Port Emulation

If you connect the scanner to the host device via a USB connection, the **USB COM Port Emulation** feature allows the Host to receive data in the way as a serial port does. A driver is required for this feature.

||||| |||||| ||| ||||||| ||| |||||
@INTERF2

USB COM Port Emulation

USB HID-POS

Introduction

The USB HID-POS interface is recommended for new application programs. It can send up to 56 characters in a single USB report and appears more efficient than keyboard emulation.

Features:

✧ HID based, no custom driver required.

✧ Way more efficient in communication than keyboard emulation and traditional RS-232 interface.

Note: USB HID-POS does not require a custom driver. However, a HID interface on Windows 98 does. All HID interfaces employ standard driver provided by the operating system. Use defaults when installing the driver.

||||| |||||| ||| ||||||| ||| |||||
@INTERF5

USB HID-POS

Access the Scanner with Your Program

Use CreateFile to access the scanner as a HID device and then use ReadFile to deliver the scanned data to the application program. Use WriteFile to send data to the scanner.

For detailed information about USB and HID interfaces, go to www.USB.org.

Acquire Scanned Data

After scanning and decoding a barcode, the scanner sends the following input report:

	Bit							
Byte	7	6	5	4	3	2	1	0
0	Report ID = 0x02							
1	Length of the barcode							
2-57	Decoded data (1-56)							
58-60	AIM ID							
61-62	Reserved							
63	-	-	-	-	-	-	-	Decoded Data Continued

Send Data to the Scanner

This output report is used to send data to the device. All programming commands can be used.

	Bit							
Byte	7	6	5	4	3	2	1	0
0	Report ID = 0x04							
1	Length of the output data							
2-63	Output data (1-62)							

VID/PID

USB uses VID (Vendor ID) and PID (Product ID) to identify and locate a device. The VID is assigned by USB Implementers Forum. Newland's vendor ID is 1EAB (Hex). A PID is assigned to each interface.

Product	Interface	PID (Hex)	PID (Dec)
FM30	USB HID-KBW	1A03	6659
	USB COM Port Emulation	1A06	6662
	USB HID-POS	1A10	6672

Chapter 3 Scan Mode

Sense Mode

The scanner waits for the image stabilization timeout to expire before activating a decode session every time it detects a change in ambient illumination. Decode session continues until the barcode is decoded or the decode session timeout expires.

@SCNMOD2
** Sense Mode

Decode Session Timeout

This parameter sets the maximum time decode session continues during a scan attempt. It is programmable in 1ms increments from 100ms to 3,600,000ms. When it is set to 0, the timeout is infinite. The default setting is 3,000ms. To learn how to program this parameter, see **Appendix 5**.

@ORTSET
Decode Session Timeout

Image Stabilization Timeout

This parameter defines the amount of time that the scanner waits for the image to stabilize to a point that it can be decoded with more accuracy. It is programmable in 100ms increments from 0ms to 1,600ms. The default setting is 100ms. To learn how to program this parameter, see **Appendix 5**.

||||| |||| ||| ||||| |||||
@SENIST

Image Stabilization Timeout

Timeout between Decodes

This parameter sets the timeout between decode sessions. When a decode session ends, next session will not happen until the timeout between decodes expires. It is programmable in 1ms increments from 0ms to 65,535ms. The default setting is 200ms. To learn how to program this parameter, see **Appendix 5**.

||||| |||| ||| ||||| |||||
@SCNINV

Timeout between Decodes

Timeout between Decodes (Same Barcode)

Timeout between Decodes (Same Barcode) can avoid undesired rereading of same barcode in a given period of time.

To enable/disable the Timeout between Decodes (Same Barcode), scan the appropriate barcode below.

Enable Timeout between Decodes (Same Barcode): Do not allow the scanner to re-read same barcode before the timeout between decodes (same barcode) expires.

Disable Timeout between Decodes (Same Barcode): Allow the scanner to re-read same barcode.

@RRDENA0

Disable Timeout between Decodes (Same Barcode)

@RRDENA1

** Enable Timeout between Decodes (Same Barcode)

The following parameter sets the timeout between decodes for same barcode. It is programmable in 1ms increments from 0ms to 65,535ms. The default setting is 1,500ms.

To learn how to program this parameter, see **Appendix 5**.

@RRDDUR

Timeout between Decodes (Same Barcode)

Sensitivity

Sensitivity specifies the degree of acuteness of the scanner's response to changes in ambient illumination. The higher the sensitivity, the lower requirement in illumination change to trigger the scanner. You can select an appropriate degree of sensitivity that fits the ambient environment.

```
@SENLVL8
```
Medium Sensitivity (Threshold value: 8)

```
@SENLVL14
```
Low Sensitivity (Threshold value: 14)

```
@SENLVL5
```
** High Sensitivity　(Threshold value: 5)

```
@SENLVL2
```
Enhanced Sensitivity (Threshold value: 2)

If the above four options fail to meet your needs, you may program the threshold value of illumination change.

Illumination changes that reach or surpass the predefined threshold value will cause the scanner to start a decode session. The lower the threshold value, the greater the sensitivity of the scanner.

To learn how to program this parameter, see **Appendix 5**.

```
@SENLVL
```
Threshold Value of Illumination Change (1-16)

Continuous Mode

If the Continuous mode is enabled, the scanner automatically starts one decode session after another.

Continuous Mode

Decode Session Timeout

This parameter sets the maximum time decode session continues during a scan attempt. It is programmable in 1ms increments from 100ms to 3,600,000ms. When it is set to 0, the timeout is infinite. The default setting is 3,000ms. To learn how to program this parameter, see **Appendix 5**.

Decode Session Timeout

Timeout between Decodes

This parameter sets the timeout between decode sessions. When a decode session ends, next session will not happen until the timeout between decodes expires. It is programmable in 1ms increments from 0ms to 65,535ms. The default setting is 200ms. To learn how to program this parameter, see **Appendix 5**.

Timeout between Decodes

** Exit Setup

Timeout between Decodes (Same Barcode)

Timeout between Decodes (Same Barcode) can avoid undesired rereading of same barcode in a given period of time.

To enable/disable the Timeout between Decodes (Same Barcode), scan the appropriate barcode below.

Enable Timeout between Decodes (Same Barcode): Do not allow the scanner to re-read same barcode before the timeout between decodes (same barcode) expires.

Disable Timeout between Decodes (Same Barcode): Allow the scanner to re-read same barcode.

@RRDENA0

Disable Timeout between Decodes (Same Barcode)

@RRDENA1

** Enable Timeout between Decodes (Same Barcode)

The following parameter sets the timeout between decodes for same barcode. It is programmable in 1ms increments from 0ms to 65,535ms. The default setting is 1,500ms.

To learn how to program this parameter, see **Appendix 5**.

@RRDDUR

Timeout between Decodes (Same Barcode)

Chapter 4 Scanning Preferences

Introduction

This chapter contains information as to how to adapt your scanner to various applications with preference setting. For instance, to narrow the field of view of the scanner to make sure it reads only those barcodes intended by the user.

Decode Area

Whole Area Decoding

When this option is enabled, the scanner attempts to decode barcode(s) within its field of view, from the center to the periphery, and transmits the barcode that has been first decoded.

‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖
@CADENA0
** Whole Area Decoding

Specific Area Decoding

The scanner attempts to read barcode(s) within a specified decoding area and transmits the barcode that has been first decoded. This option allows the scanner to narrow its field of view to make sure it reads only those barcodes intended by the user. For instance, if multiple barcodes are placed closely together, specific area decoding in conjunction with appropriate pre-defined decoding area will insure that only the desired barcode is read.

‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖‖
@CADENA1
Specific Area Decoding

Specify Decoding Area

If **Specific Area Decoding** is enabled, the scanner only reads barcodes that intersect the predefined decoding area.

The default decoding area is an area of 40% top, 60% bottom, 40% left and 60% right of the scanner's field of view, as shown in the figure below. In the following example, the white box is the decoding area. Since Barcode 1 passes through the decoding area, it will be read. Barcode 2 does not pass through the decoding area, so it will not be read.

You can define the decoding area using the **Top of Decoding Area**, **Bottom of Decoding Area**, **Left of Decoding Area** and **Right of Decoding Area** barcodes as well as numeric barcode(s) that represent(s) a desired percentage (0-100). To learn how to program decoding area, see **Appendix 5**.

A bad read message can contain 0-7 characters.

@NGRSET

Set Bad Read Message

Chapter 7 Prefix & Suffix

In many applications, barcode data needs to be edited and distinguished from one another.

Usually AIM ID and Code ID can be used as identifiers, but in some special cases customized prefix and terminating character suffix like Carriage Return or Line Feed can also be the alternatives.

Data editing may include:

- ✧ Append AIM ID/Code ID/custom prefix before the decoded data
- ✧ Append custom suffix after the decoded data
- ✧ Append terminating character to the end of the data

The following formats can be used when editing barcode data:

- ✧ [Code ID] + [Custom Prefix] + [AIM ID] + [DATA] + [Custom Suffix] + [Terminating Character]
- ✧ [Custom Prefix] + [Code ID] + [AIM ID] + [DATA] + [Custom Suffix] + [Terminating Character]

Note: [DATA] must be transmitted while user can decide whether to transmit any of the rest parts.
Global Settings

Enable/Disable All Prefixes/Suffixes

✧ **Disable All Prefixes/Suffixes:** Transmit barcode data with no prefix/suffix.

✧ **Enable All Prefixes/Suffixes:** Allow user to append Code ID prefix, AIM ID prefix, custom prefix/suffix and terminating character to the barcode data before the transmission.

Chapter 10 Data Formatter

Introduction

You may use the Data Formatter to modify the scanner's output. For example, you can use the Data Formatter to insert characters at certain points in barcode data or to suppress/ replace/ send certain characters in barcode data as it is scanned.

Normally, when you scan a barcode, it gets outputted automatically; however, when you create a format, you must use a "send" command (see the "Send Commands" section in this chapter) within the format programming to output data. The maximum size of formatter commands in a data format is 112 characters. By default, the data formatter is disabled. Enable it when required. If you have changed data format settings, and wish to clear all formats and return to the factory defaults, scan the **Default Data Format** code below.

@DFMDEF
**** Default Data Format**

Add a Data Format

Data format is used to edit barcode data only. You can program up to four data formats, i.e. Format_0, Format_1, Format_2 and Format_3. When you create a data format, you must specify the application scope of your data format (such as barcode type and data length) and include formatter commands. When scanned data does not match your data format requirements, you will hear the non-match error beep (if the non-match error beep is ON).

The following explains how to program a data format by scanning the specific barcodes. Scanning any irrelevant barcode or failing to follow the setting procedure will result in programming failure. To find the alphanumeric barcodes needed to create a data format, see **Appendix 6: Digit Barcodes**.
Step 1: Scan the **Enter Setup** barcode.

Step 2: Scan the **Add Data Format** barcode.

@DFMSET

Add Data Format

Step 3: Select data format.
Scan a numeric barcode **0** or **1** or **2** or **3** to set this to Format_0 or Format_1 or Format_2 or Format_3.

Step 4: Select formatter command type.
Specify what type of formatter commands will be used. Scan a numeric barcode "6" to select formatter command type 6. (See the "Formatter Command Type 6" section in this chapter for more information)

Step 5: Set interface type
Scan **999** for any interface type.

Step 6: Set Symbology ID Number
Refer to **Appendix 10: Symbology ID Number** and find the ID number of the symbology to which you want to apply the data format. Scan three numeric barcodes for the symbology ID number. If you wish to create a data format for all symbologies, scan **999**.

Step 7: Set barcode data length
Specify what length of data will be acceptable for this symbology. Scan the four numeric barcodes that represent the data length. 9999 is a universal number, indicating all lengths. For example, 32 characters should be entered as 0032.

Step 8: Enter formatter command
Refer to the "Formatter Command Type 6" section in this chapter. Scan the alphanumeric barcodes that represent the command you need to edit data. For example, when a command is F141, you should scan F141. A command can contain up to 112 characters.

Step 9: Scan the **Save** barcode from **Appendix 7: Save/Cancel Barcodes** to save your data format.
To streamline the programming process, you may as well generate a batch barcode by inputting the command (e.g. **@DFMSET069990020010F141;**) used to create a data format. See the "Use Batch Barcode" section in Chapter 11 to learn how to put a batch barcode into use.

Example: Program format_0 using formatter command type 6, Code 128 containing 10 characters applicable, send all characters followed by "A".

1. Scan the **Enter Setup** barcode   Enter the Setup mode

2. Scan the **Add Data Format** barcode   Add a data format

3. Scan the **0** barcode   Select format_0

4. Scan the **6** barcode   Select formatter command type 6

5. Scan the **9** barcode three times   All interface types applicable

6. Scan the barcodes **002**   Only Code 128 applicable

7. Scan the barcodes **0010**   Only a length of 10 characters applicable

8. Scan the alphanumeric barcodes **F141**   Send all characters followed by "A" (HEX: 41)

9. Scan the **Save** barcode   Save the data format
Enable/Disable Data Formatter

When Data Formatter is disabled, the data format you have enabled becomes invalid.

@DFMENA0

** Disable Data Formatter

You may wish to require the data to conform to a data format you have created. The following settings can be applied to your data format:

Enable Data Formatter, Required, Keep Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted along with prefixes and suffixes (if prefix and suffix are enabled). Any data that does not match your data format requirements generates an error beep (if Non-Match Error Beep is turned ON) and the data in that barcode is not transmitted.

Enable Data Formatter, Required, Drop Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted without prefixes and suffixes (even if prefix and suffix are enabled). Any data that does not match your data format requirements generates an error beep (if Non-Match Error Beep is turned ON) and the data in that barcode is not transmitted.

Enable Data Formatter, Not Required, Keep Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted along with prefixes and suffixes (if prefix and suffix are enabled). Barcode data that does not match your data format requirements is transmitted as read along with prefixes and suffixes (if prefix and suffix are enabled).

Enable Data Formatter, Not Required, Drop Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted without prefixes and suffixes (even if prefix and suffix are enabled). Barcode data that does not match your data format requirements is transmitted as read along with prefixes and suffixes (if prefix and suffix are enabled).
‖‖‖‖‖‖‖‖‖‖‖
@DFMENA1

Enable Data Formatter, Required, Keep Prefix/Suffix

‖‖‖‖‖‖‖‖‖‖‖
@DFMENA2

‖‖‖‖‖‖‖‖‖‖‖
@DFMENA3

Enable Data Formatter, Not Required, Keep Prefix/Suffix

‖‖‖‖‖‖‖‖‖‖‖
@DFMENA4

Enable Data Formatter, Not Required, Drop Prefix/Suffix

Non-Match Error Beep

If Non-Match Error Beep is turned ON, the scanner generates an error beep when a barcode is encountered that does not match your required data format.

‖‖‖‖‖‖‖‖‖‖‖
@DFMTON1

** Non-Match Error Beep ON

‖‖‖‖‖‖‖‖‖‖‖
@DFMTON0

Non-Match Error Beep OFF

‖‖‖‖‖‖‖‖‖‖‖
@SETUPN0
** Exit Setup

Data Format Selection

After enabling the Data Formatter, you may select a data format you want to use by scanning the appropriate barcode below.
@DFMUSE0
** Format_0

@DFMUSE1
Format_1

@DFMUSE2
Format_2

@DFMUSE3
Format_3

Change Data Format for a Single Scan

You can switch between data formats for a single scan. The next barcode is scanned using the data format selected here, then reverts to the format you have selected above. For example, you may have set your scanner to the data format you saved as Format_3. You can switch to Format_1 for a single scan by scanning the **Single Scan – Format_1** barcode below. The next barcode that is scanned uses Format_1, then reverts back to Format_3.

Note: This setting will be lost by removing power from the scanner, or turning off/ rebooting the device.

#DFMSIN0
Single Scan – Format_0
#DFMSIN1
Single Scan – Format_1

#DFMSIN2
Single Scan – Format_2
#DFMSIN3
Single Scan – Format_3

Clear Data Format

There are two methods to remove data format from your scanner:

Delete one data format: Scan the **Clear One** barcode, a numeric barcode (0-3) and the **Save** barcode. For example, to delete Format_2, you should scan the **Clear One** barcode, the **2** barcode and the **Save** barcode.

Delete all data formats: Scan the **Clear All** barcode.

@DFMCAL

Clear All

@DFMCLR

Clear One

Query Data Formats

You may scan the appropriate barcode below to get the information of data format(s) created by you or preset by manufacturer. For instance, if you have added Format_0 as per the example in the "Add a Data Format" section in this chapter, scanning the **Query Current Data Formats** barcode, you will get the result: **Data Format0:069990020010F141;**.
@DFMQCU

Query Current Data Formats
@DFMQFA

Query Preset Data Formats

Formatter Command Type 6

When working with the Data Formatter, a virtual cursor is moved along your input data string. The following commands are used to both move this cursor to different positions, and to select, replace, and insert data into the final output. For the hex value of ASCII characters involved in the commands, refer to **Appendix 4: ASCII Table**.

Send Commands

F1 Send all characters

Syntax=F1xx (xx: The insert character's hex value)

Include in the output message all of the characters from the input message, starting from current cursor position, followed by an insert character.

F2 Send a number of characters

Syntax=F2nnxx (nn: The numeric value (00-99) for the number of characters; xx: The insert character's hex value)

Include in the output message a number of characters followed by an insert character. Start from the current cursor position and continue for "nn" characters or through the last character in the input message, followed by character "xx."

F2 Example: Send a number of characters

1234567890ABCDEFGHIJ

Send the first 10 characters from the barcode above, followed by a carriage return.

Command string: **F2100D**

F2 is the "Send a number of characters" command

10 is the number of characters to send

0D is the hex value for a CR

The data is output as: **1234567890**

                                 <CR>
F3 Send all characters up to a particular character

Syntax=F3ssxx (ss: The particular character's hex value; xx: The insert character's hex value)

Include in the output message all characters from the input message, starting with the character at the current cursor position and continuing to, but not including, the particular character "ss," followed by character "xx." The cursor is moved forward to the "ss" character.

F3 Example: Send all characters up to a particular character

1234567890ABCDEFGHIJ

Using the barcode above, send all characters up to but not including "D," followed by a carriage return.

Command string: **F3440D**

F3 is the "Send all characters up to a particular character" command

44 is the hex value for a "D"

0D is the hex value for a CR

The data is output as: **1234567890ABC**

<CR>

E9 Send all but the last characters

Syntax=E9nn (nn: The numeric value (00-99) for the number of characters that will not be sent at the end of the message)

Include in the output message all but the last "nn" characters, starting from the current cursor position. The cursor is moved forward to one position past the last input message character included.

F4 Insert a character multiple times

Syntax=F4xxnn (xx: The insert character's hex value; nn: The numeric value (00-99) for the number of times it should be sent)

Send "xx" character "nn" times in the output message, leaving the cursor in the current position.

E9 and F4 Example: Send all but the last characters, followed by 2 tabs

![barcode 1234567890ABCDEFGHIJ]

Send all characters except for the last 8 from the barcode above, followed by 2 tabs.

Command string: **E908F40902**

E9 is the "Send all but the last characters" command

08 is the number of characters at the end to ignore

F4 is the "Insert a character multiple times" command

09 is the hex value for a horizontal tab

02 is the number of times the tab character is sent

The data is output as: **1234567890AB<tab><tab>**

B3 Insert symbology name

Insert the name of the barcode's symbology in the output message, without moving the cursor.

B4 Insert barcode length

Insert the barcode's length in the output message, without moving the cursor. The length is expressed as a numeric string and does not include leading zeros.
B3 and B4 Example: Insert the symbology name and length

1234567890ABCDEFGHIJ

Send the symbology name and length before the barcode data from the barcode above. Break up these insertions with spaces. End with a carriage return.

Command string: **B3F42001B4F42001F10D**

B3 is the "Insert symbology name" command

F4 is the "Insert a character multiple times" command

20 is the hex value for a space

01 is the number of time the space character is sent

B4 is the "Insert barcode length" command

F4 is the "Insert a character multiple times" command

20 is the hex value for a space

01 is the number of time the space character is sent

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as: **Code128 20 1234567890ABCDEFGHIJ**
                                        <CR>

Move Commands

F5 Move the cursor forward a number of characters

Syntax=F5nn (nn: The numeric value (00-99) for the number of characters the cursor should be moved ahead)

Move the cursor ahead "nn" characters from current cursor position.

F5 Example: Move the cursor forward and send the data

1234567890ABCDEFGHIJ

Move the cursor forward 3 characters, then send the rest of the barcode data from the barcode above. End with a carriage return.

Command string: **F503F10D**

F5 is the "Move the cursor forward a number of characters" command

03 is the number of characters to move the cursor

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as: **4567890ABCDEFGHIJ**
<CR>

F6 Move the cursor backward a number of characters

Syntax=F6nn (nn: The numeric value (00-99) for the number of characters the cursor should be moved back)

Move the cursor back "nn" characters from current cursor position.

F7 Move the cursor to the beginning

Syntax＝F7

Move the cursor to the first character in the input message.

EA Move the cursor to the end

Syntax＝EA

Move the cursor to the last character in the input message.
Search Commands

F8 Search forward for a character

Syntax＝F8xx (xx: The search character's hex value)

Search the input message forward for "xx" character from the current cursor position, leaving the cursor pointing to the "xx" character.

F8 Example: Send barcode data that starts after a particular character

1234567890ABCDEFGHIJ

Search for the letter "D" in barcodes and send all the data that follows, including the "D". Using the barcode above:

Command string: **F844F10D**

F8 is the "Search forward for a character" command

44 is the hex value for "D"

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as: **DEFGHIJ**

      <CR>

F9 Search backward for a character

Syntax＝F9xx (xx: The search character's hex value)

Search the input message backward for "xx" character from the current cursor position, leaving the cursor pointing to the "xx" character.

B0 Search forward for a string

Syntax=B0nnnnS (nnnn: The string length (up to 9999); S: The ASCII hex value of each character in the string)

Search forward for "S" string from the current cursor position, leaving cursor pointing to "S" string. For example, B0000454657374 will search forward for the first occurrence of the 4-character string "Test."

B0 Example: Send barcode data that starts after a string of characters

1234567890ABCDEFGHIJ

Search for the letters "FGH" in barcodes and send all the data that follows, including "FGH." Using the barcode above:

Command string: **B00003464748F10D**

B0 is the "Search forward for a string" command

0003 is the string length (3 characters)

46 is the hex value for "F"

47 is the hex value for "G"

48 is the hex value for "H"

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as: **FGHIJ**
                                                      <CR>

B1 Search backward for a string

Syntax＝B1nnnnS (nnnn: The string length (up to 9999); S: The ASCII hex value of each character in the string)

Search backward for "S" string from the current cursor position, leaving cursor pointing to "S" string. For example, B1000454657374 will search backward for the first occurrence of the 4-character string "Test."
E6 Search forward for a non-matching character

Syntax=E6xx (xx: The search character's hex value)

Search the input message forward for the first non-"xx" character from the current cursor position, leaving the cursor pointing to the non-"xx" character.

E6 Example: Remove zeros at the beginning of barcode data

This example shows a barcode that has been zero filled. You may want to ignore the zeros and send all the data that follows. E6 searches forward for the first character that is not zero, then sends all the data after, followed by a carriage return. Using the barcode above:

Command string: **E630F10D**

E6 is the "Search forward for a non-matching character" command

30 is the hex value for 0

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as: **37692**

<CR>

E7 Search backward for a non-matching character

Syntax＝E7xx (xx: The search character's hex value)

Search the input message backward for the first non-"xx" character from the current cursor position, leaving the cursor pointing to the non-"xx" character.
Miscellaneous Commands

FB Suppress characters

Syntax＝FBnnxxyy..zz (nn: The numeric value (00-15) for the number of suppressed characters; xxyy..zz: The hex value of the characters to be suppressed)

Suppress all occurrences of up to 15 different characters, starting at the current cursor position, as the cursor is advanced by other commands.

FB Example: Remove spaces in barcode data

345 678 90

This example shows a barcode that has spaces in the data. You may want to remove the spaces before sending the data. Using the barcode above:

Command string: **FB0120F10D**

FB is the "Suppress characters" command

01 is the number of the characters to be suppressed

20 is the hex value for a space

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as: **34567890**

<CR>
E4 Replace characters

Syntax＝E4nnxx$_1$xx$_2$yy$_1$yy$_2$…zz$_1$zz$_2$ (nn: The total count of the number of characters (characters to be replaced plus replacement characters; xx$_1$: The characters to be replaced, xx$_2$: The replacement characters, continuing through zz$_1$ and zz$_2$)

Replace up to 15 characters in the output message, without moving the cursor.

E4 Example: Replace zeros with CRs in barcode data

1234056780ABC

If the barcode has characters that the host application does not want included, you can use the E4 command to replace those characters with something else. In this example, you will replace the zeros in the barcode above with carriage returns.

Command string: **E402300DF10D**

E4 is the "Replace characters" command

02 is the total count of characters to be replaced, plus the replacement characters (0 is replaced by CR, so total characters=2)

30 is the hex value for 0

0D is the hex value for a CR (the character that will replace the 0)

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as: **1234**
               5678
               ABC
               <CR>

BA Replace a string with another

Syntax＝BAnnNN₁SS₁NN₂SS₂

nn: The count of replacements to be made, if nn=00 or nn>=the number of occurrences of a string to be replaced, then replace all occurrences of that string.

NN_1: The length of the string to be replaced, $NN_1>0$.

SS_1: The ASCII hex value of each character in the string to be replaced.

NN_2: The length of replacement string, $NN_2>=0$. To replace string "SS_1" with NUL (i.e. delete string "SS_1"), you should set NN_2 to 00 and leave out SS_2.

SS_2: The ASCII hex value of each character in the replacement string

From the current cursor position, search forward for the occurrence of "SS_1" string (of length "NN_1") and replace the string with "SS_2" string (of length "NN_2") in the output message until every "SS_1" string is replaced or the count of replacements made reaches "nn" times, without moving the cursor.

BA Example: Replace "23"s with "ABC"s in barcode data

cd123abc23bc12ab232

If the barcode has a string of characters that the host application does not want included, you can use the BA command to replace the string with something else. In this example, you will replace the "23"s in the barcode above with "ABC"s.

Command string: **BA0002323303414243F100**

BA is the "Replace a string with another" command

00 is the count of replacements to be made, 00 means to replace all occurrences of that string

02 is the length of the string to be replaced
32 is the hex value for 2 (character in the string to be replaced)

33 is the hex value for 3 (character in the string to be replaced)

03 is the length of the replacement string

41 is the hex value for A (character in the replacement string)

42 is the hex value for B (character in the replacement string)

43 is the hex value for C (character in the replacement string)

F1 is the "Send all characters" command

00 is the hex value for a NUL

The data is output as: **cd1ABCabcABCbc12abABC2**

BA Example: Remove only the first occurrence of "23"s in barcode data

If the barcode has a string of characters that the host application wants removed, you can use the BA command to replace the string with NUL. In this example, you will remove the first occurrence of "23" in the barcode above.

Command string: **BA0102323300F100**

BA is the "Replace a string with another" command

01 is the count of replacements to be made

02 is the length of the string to be replaced

32 is the hex value for 2 (character in the string to be replaced)

33 is the hex value for 3 (character in the string to be replaced)

00 is the length of the replacement string, 00 means to replace the string to be replaced with NUL

F1 is the "Send all characters" command

00 is the hex value for a NUL

The data is output as: **cd1abc23bc12ab232**
EF Insert a delay

Syntax＝EFnnnn (nnnn: The delay in 5ms increments, up to 9999)

Inserts a delay of up to 49,995 milliseconds (in multiples of 5), starting from the current cursor position. This command can only be used with USB HID-KBW.

EF Example: Insert a delay of 1s in between the 5th and 6th character

Send the first 5 characters in a barcode, wait for 1s, then send the rest of the barcode data.

Command string: **F20500EF0200E900**

F2 is the "Send a number of characters" command

05 is the number of characters to send

00 is the hex value for a Null character

EF is the "Insert a delay" command

0200 is the delay value (5msX200=1000ms=1s)

E9 is the "Send all but the last characters" command

00 is the number of characters that will not be sent at the end of the message
Chapter 11 Batch Programming

Introduction

Batch programming enables users to integrate a batch of commands into a single batch barcode.

Listed below are batch programming rules:

1. Command format: Command + Parameter Value.

2. Each command is terminated by a semicolon (;). Note that there is no space between a command and its terminator semicolon.

3. Use the barcode generator software to generate a 2D batch barcode.

Example: Create a batch barcode for **Illumination Always On**, **Sense Mode**, **Decode Session Timeout = 2s**:

1. Input the commands:

   @ILLSCN2;SCNMOD2;ORTSET2000;

2. Generate a batch barcode.

   When setting up a scanner with the above configuration, scan the **Enable Batch Barcode** barcode and then the batch barcode generated.

@BATCHS

Enable Batch Barcode

Create a Batch Command

A batch command may contain a number of individual commands each of which is terminated by a semicolon (;).

For more information, refer to the *Serial Programming Command Manual*.

Create a Batch Barcode

Batch barcodes can be produced in the format of PDF417, QR Code or Data Matrix.

Example: Create a batch barcode for **Illumination Always On**, **Sense Mode**, **Decode Session Timeout** = 2s:

1. Input the following commands:

   @ILLSCN2;SCNMOD2;ORTSET2000;

2. Generate a PDF417 batch barcode.

Use Batch Barcode

To put a batch barcode into use, scan the following barcodes. (Use the example above.)
‖|‖‖|‖|‖‖|‖|‖‖|‖|
@SETUPN1
Enter Setup

‖|‖‖|‖|‖‖|‖|‖‖|‖|
@BATCHS
Enable Batch Barcode

Batch Barcode

‖|‖‖|‖|‖‖|‖|‖‖|‖|
@SETUPN0
Exit Setup

Chapter 12 Troubleshooting

FAQ

Problem: Some barcodes cannot be read.

Solution:
1. Find out the barcode type and verify that the barcode type is enabled. If the barcode parameters include check character verification, select the Disable option.
2. If you do not know the barcode type, enable all symbologies.
3. If they are inverse barcodes (bright images on a dark background), enable the Video Reverse feature.

Problem: Incorrect output.

Solution:
1. If this problem happens to all barcodes and additional characters appear before/after barcode data, disable all prefix/suffix.
2. If this problem only happens to some barcodes and matches one of the following situations:
a) incomplete barcode data: Enable the check character verification.
b) both the first and last characters are asterisks (*): Disable the transmission of start/stop characters of Code 39.
c) "a" transmitted as "+A": Enable Code 39 Full ASCII.

Problem: Barcodes can be read, but cannot be displayed.

Solution: Verify that the serial port parameter (such as baud rate, data bit and stop bit) settings match the host requirements.

Problem: Illumination beam is OFF.

Solution:
1. Verify that the scanner is properly powered up.
2. Send "?" to the scanner. If the scanner returns a reply of "!", then send programming commands to turn illumination on.

Problem: Carriage Return/Line Feed settings.

Solution: See the "Terminating Character Suffix" section in Chapter 7.

Appendix

Appendix 1: Factory Defaults Table

Parameter		Factory Default	Remark
Programming Barcode			
Barcode Programming		Disabled	
Programming Barcode Data		Do not send	
Communication Settings			
RS-232	Baud Rate	115200	
	Parity Check	None	
	Data Bits	8	
	Stop Bits	1	
HID-KBW	USB Country Keyboard Type	U.S.	
	Beep on Unknown Character	Do not beep	
	Inter-Keystroke Delay	10ms	
	Convert Case	No conversion	
	Emulate ALT + Keypad	Disabled	
	Function Key Mapping	Disabled	
	Emulate Numeric Keypad	Disabled	
	Code Page	Windows 1252 (Latin I)	
	Polling Rate	1ms	
Scan Mode			
Default Scan Mode		Sense mode	

Parameter		Factory Default	Remark
Sense Mode	Decode Session Timeout	3,000ms	Applicable to Sense mode and Continuous mode. 100~3,600,000ms; 0: Infinite
	Image Stabilization Timeout	100ms	0~1,600ms
	Timeout between Decodes	200ms	Applicable to Sense mode and Continuous mode. 0~65,535ms
	Timeout between Decodes (Same Barcode)	Enabled 1,500ms	Applicable to Sense mode and Continuous mode. 0~65,535ms
	Threshold Value of Illumination Change	5 ()	1~16
Continuous Mode	Decode Session Timeout	3,000ms	Applicable to Sense mode and Continuous mode. 100~3,600,000ms; 0: Infinite
	Timeout between Decodes	200ms	Applicable to Sense mode and Continuous mode. 0~65,535ms
	Timeout between Decodes (Same Barcode)	Enabled 1,500ms	Applicable to Sense mode and Continuous mode. 0~65,535ms

Appendix 5: Parameter Programming Examples

The following examples show you how to program parameters by scanning programming barcodes.

a. Program the Decode Session Timeout

Example: Set the decode session timeout to 1500ms
1. Scan the **Enter Setup** barcode.
2. Scan the **Decode Session Timeout** barcode from the "Decode Session Timeout" section in Chapter 3.
3. Scan the numeric barcodes "1", "5", "0" and "0".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

b. Program the Image Stabilization Timeout

Example: Set the image stabilization timeout to 500ms
1. Scan the **Enter Setup** barcode.
2. Scan the **Image Stabilization Timeout** barcode from the "Image Stabilization Timeout" section in Chapter 3.
3. Scan the numeric barcodes "5", "0" and "0".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

c. Program the Timeout between Decodes (Same Barcode)

Example: Set the timeout between decodes (same barcode) to 1000ms
1. Scan the **Enter Setup** barcode.
2. Scan the **Timeout between Decodes (Same Barcode)** barcode from the "Timeout between Decodes (Same Barcode)" section in Chapter 3.
3. Scan the numeric barcodes "1", "0", "0" and "0".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

d. Program the Threshold Value of Illumination Change

Example: Set the threshold value of illumination change to 4

1. Scan the **Enter Setup** barcode.
2. Scan the **Threshold Value of Illumination Change** barcode from the "Sensitivity" section in Chapter 3.
3. Scan the numeric barcode "4".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

e. Program the Timeout between Decodes

Example: Set the timeout between decodes to 500ms

1. Scan the **Enter Setup** barcode.
2. Scan the **Timeout between Decodes** barcode from the "Timeout between Decodes" section in Chapter 3.
3. Scan the numeric barcodes "5", "0" and "0".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

f. Program the Decoding Area

Example: Set the decoding area to 20% top, 80% bottom, 20% left and 80% right.

1. Scan the **Enter Setup** barcode.
2. Scan the **Specific Area Decoding** barcode from the "Specific Area Decoding" section in Chapter 4.
3. Scan the **Top of Decoding Area** barcode from the "Specify Decoding Area" section in Chapter 4.
4. Scan the numeric barcodes "2" and "0".
5. Scan the **Save** barcode.
6. Scan the **Bottom of Decoding Area** barcode from the "Specify Decoding Area" section in Chapter 4.
7. Scan the numeric barcodes "8" and "0".
8. Scan the **Save** barcode.
9. Scan the **Left of Decoding Area** barcode from the "Specify Decoding Area" section in Chapter 4.
10. Scan the numeric barcodes "2" and "0".
11. Scan the **Save** barcode.
12. Scan the **Right of Decoding Area** barcode from the "Specify Decoding Area" section in Chapter 4.
13. Scan the numeric barcodes "8" and "0".
14. Scan the **Save** barcode.
15. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

g. Program the Custom Prefix/Suffix

Example: Set the custom prefix to "CODE"

1. Check the hex values of "CODE" in the ASCII Table. ("CODE": 43, 4F, 44, 45)
2. Scan the **Enter Setup** barcode.
3. Scan the **Set Custom Prefix** barcode from the "Set Custom Prefix" section in Chapter 6.
4. Scan the numeric barcodes "4", "3", "4", "F", "4", "4", "4" and "5".
5. Scan the **Save** barcode.
6. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

h. Program the Terminating Character Suffix

Example: Set the terminating character suffix to 0x0D

1. Scan the **Enter Setup** barcode.
2. Scan the **Set Terminating Character Suffix** barcode from the "Set Terminating Character Suffix" section in Chapter 6.
3. Scan the numeric barcodes "0" and "D".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

i. Program the Code ID

Example: Set the Code ID of PDF 417 to "p"

1. Check the hex value of "p" in the ASCII Table. ("p": 70)
2. Scan the **Enter Setup** barcode.
3. Scan the **Modify PDF417 Code ID** barcode from the "Modify Code ID" section in Chapter 6.
4. Scan the numeric barcodes "7" and "0".
5. Scan the **Save** barcode.
6. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

j. Program the Bad Read Message

Example: Set the bad read message to "!ERR"

1. Check the hex values of "!ERR" in the ASCII Table. ("!ERR": 21, 45, 52, 52)
2. Scan the **Enter Setup** barcode.
3. Scan the **Set Bad Read Message** barcode from the "Bad Read Message" section in Chapter 5.
4. Scan the numeric barcodes "2", "1", "4", "5", "5", "2", "5" and "2".
5. Scan the **Save** barcode.
6. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

k. Program the Length Range (Maximum/Minimum Lengths) for a Symbology

Note: If minimum length is set to be greater than maximum length, the scanner only decodes barcodes with either the minimum or maximum length. If you only want to read barcodes with a specific length, set both minimum and maximum lengths to be that desired length.

Example: Set the scanner to decode Code 128 barcodes containing between 8 and 12 characters

1. Scan the **Enter Setup** barcode.
2. Scan the **Set the Minimum Length** barcode from the "Set Length Range for Code 128" section in Chapter 7.
3. Scan the numeric barcode "8".
4. Scan the **Save** barcode.
5. Scan the **Set the Maximum Length** barcode from the "Set Length Range for Code 128" section in Chapter 7.
6. Scan the numeric barcodes "1" and "2".
7. Scan the **Save** barcode.
8. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

l. Program the Custom Inter-keystroke Delay

Example: Set the inter-keystroke delay to 5ms

1. Scan the **Enter Setup** barcode.
2. Scan the **Custom Delay** barcode from the "Inter-Keystroke Delay" section in Chapter 2.
3. Scan the numeric barcodes "5".
4. Scan the **Save** barcode.
5. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

m. Program the scanner to get proper output for Russian encoded with Windows 1251

1. Scan the **Enter Setup** barcode.
2. Scan the **Windows 1251 (Cyrillic)** barcode from the "Code Page" section in Chapter 2.
3. Scan the appropriate **Default Character Encoding** barcode according to the symbology your application needs from the "Character Encoding" section in Chapter 8.
4. Scan the **Mode 3** barcode from the "Emulate ALT+Keypad" section in Chapter 2.
5. Scan the **Exit Setup** barcode. (If you still need to program other parameter/feature, skip this step.)

n. Program the scanner to get proper output for Russian encoded with UTF-8

1. Scan the **Enter Setup** barcode.
2. Scan the **Windows 1251 (Cyrillic)** barcode from the "Code Page" section in Chapter 2.
3. Scan the appropriate **UTF-8** barcode according to the symbology your application needs from the "Character Encoding" section in Chapter 8.
4. Scan the **Mode 3** barcode from the "Emulate ALT+Keypad" section in Chapter 2.
5. Scan the **Exit** Setup barcode. (If you still need to program other parameter/feature, skip this step.)

o. Program the Custom Transmit Delay per Character for Febraban

Example: Set the transmit delay per character to 5ms

1. Scan the **Enter Setup** barcode.

2. Scan the **Set Transmit Delay per Character** barcode from the "Transmit Delay" section in Chapter 8.

3. Scan the numeric barcode "5".

4. Scan the **Save** barcode.

5. Scan the **Enable Transmit Delay per Character** barcode from the "Transmit Delay" section in Chapter 8.

6. Scan the **Exit Setup** barcode.   (If you still need to program other parameter/feature, skip this step.)

Appendix 7: Save/Cancel Barcodes

After reading numeric barcode(s), you need to scan the **Save** barcode to save the data. If you scan the wrong digit(s), you can either scan the **Cancel** barcode and then start the configuration all over again, or scan the **Delete the Last Digit** barcode and then the correct digit, or scan the **Delete All Digits** barcode and then the digits you want.

For instance, after reading the **Maximum Length** barcode and numeric barcodes "1", "2" and "3", you scan:

◇ **Delete the Last Digit:** The last digit "3" will be removed.

◇ **Delete All Digits:** All digits "123" will be removed.

◇ **Cancel:** The maximum length configuration will be cancelled. And the scanner is still in the setup mode.

@DIGSAV
Save

@DIGDEL
Delete the Last Digit

@DIGDAL
Delete All Digits

@DIGCAN
Cancel

Appendix 8: ASCII Function Key Mapping Table

ASCII Function	ASCII Value (HEX)	No Function Key Mapping	Function Key Mapping
NUL (Null char.)	00	Null	Ctrl+2
SOH (Start of Header)	01	Keypad Enter	Ctrl+A
STX (Start of Text)	02	Caps Lock	Ctrl+B
ETX (End of Text)	03	Null	Ctrl+C
EOT (End of Transmission)	04	Null	Ctrl+D
ENQ (Enquiry)	05	Null	Ctrl+E
ACK (Acknowledgment)	06	Null	Ctrl+F
BEL (Bell)	07	Enter	Ctrl+G
BS (Backspace)	08	Left Arrow	Ctrl+H
HT (Horizontal Tab)	09	Horizontal Tab	Ctrl+I
LF (Line Feed)	0A	Down Arrow	Ctrl+J
VT (Vertical Tab)	0B	Vertical Tab	Ctrl+K
FF (Form Feed)	0C	Delete	Ctrl+L
CR (Carriage Return)	0D	Enter	Ctrl+M
SO (Shift Out)	0E	Insert	Ctrl+N
SI (Shift In)	0F	Esc	Ctrl+O
DLE (Data Link Escape)	10	F11	Ctrl+P
DC1 (XON) (Device Control 1)	11	Home	Ctrl+Q
DC2 (Device Control 2)	12	Print Screen	Ctrl+R
DC3 (XOFF) (Device Control 3)	13	Backspace	Ctrl+S
DC4 (Device Control 4)	14	tab+shift	Ctrl+T
NAK (Negative Acknowledgment)	15	F12	Ctrl+U
SYN (Synchronous Idle)	16	F1	Ctrl+V
ETB (End of Trans. Block)	17	F2	Ctrl+W
CAN (Cancel)	18	F3	Ctrl+X
EM (End of Medium)	19	F4	Ctrl+Y
SUB (Substitute)	1A	F5	Ctrl+Z
ESC (Escape)	1B	F6	See the following table
FS (File Separator)	1C	F7	
GS (Group Separator)	1D	F8	
RS (Request to Send)	1E	F9	
US (Unit Separator)	1F	F10	

ASCII Function Key Mapping Table (Continued)

The function key mappings of the last five characters in the previous table differ from one keyboard layout to another.

Country/	Function Key Mapping				
Keyboard Layout	1B	1C	1D	1E	1F
United States	Ctrl+[	Ctrl+\	Ctrl+]	Ctrl+6	Ctrl+-
Belgium	Ctrl+[	Ctrl+<	Ctrl+]	Ctrl+6	Ctrl+-
Scandinavia	Ctrl+8	Ctrl+<	Ctrl+9	Ctrl+6	Ctrl+-
France	Ctrl+^	Ctrl+8	Ctrl+$	Ctrl+6	Ctrl+=
Germany		Ctrl+Ã	Ctrl++	Ctrl+6	Ctrl+-
Italy		Ctrl+\	Ctrl++	Ctrl+6	Ctrl+-
Switzerland		Ctrl+<	Ctrl+.	Ctrl+6	Ctrl+-
United Kingdom	Ctrl+[	Ctrl+¢	Ctrl+]	Ctrl+6	Ctrl+-
Denmark	Ctrl+8	Ctrl+\	Ctrl+9	Ctrl+6	Ctrl+-
Norway	Ctrl+8	Ctrl+\	Ctrl+9	Ctrl+6	Ctrl+-
Spain	Ctrl+[	Ctrl+\	Ctrl+]	Ctrl+6	Ctrl+-
